

SEO OS - Complete Beginner's Guide

Who this is for: Anyone new to SEO OS - freshers, interns, marketers, or founders who need to understand what this product is, what each tool does, and how to use the full process.

What SEO OS is in one sentence:

SEO OS is an AI-powered SEO operations platform that helps a team discover website opportunities, plan campaigns, build backlinks, send outreach, track results, and keep the site technically healthy - all from one place.

Table of contents

1. Big picture - why SEO OS exists
 2. Core concepts (must know)
 3. How to start (first 15 minutes)
 4. The recommended end-to-end process
 5. Every tool & category explained
 6. Organization-level tools
 7. Tips, shortcuts, and Demo Mode
 8. Simple glossary
 9. What is still "coming later"
-

1. Big picture - why SEO OS exists

Traditional SEO work is scattered:

- One tool for site audits
- Another for keywords
- Spreadsheets for prospects
- Gmail for outreach
- Another dashboard for reports

SEO OS connects that work into one workflow, with AI helping at each step:

```
Understand your site
  v
Find opportunities (pages/sites that can give you links or traffic)
  v
Plan campaigns
  v
Write & send outreach (with human approval)
  v
Verify backlinks & measure results
  v
Fix technical SEO issues & report to leadership
```

You do not need to be an SEO expert to use the basics. Follow the process below; AI and guided tips fill the

gaps.

2. Core concepts (must know)

Organization

Your company or agency. Users, billing (future), team roles, and company-wide settings live here.

Project

One website / client site you are optimizing (example: chefgaa.com). Almost all SEO work happens inside a Project.

Rule of thumb: 1 Project = 1 website.

Mission Control

The operations dashboard for a Project - live status of AI, campaigns, outreach, workflows, health, integrations, etc.

Opportunity

A chance to earn a backlink or SEO win (guest post site, broken link, directory, resource page, etc.).

Campaign

A planned batch of work built from opportunities (targets, content, outreach, approvals).

Backlink

A link from another website to yours. Good backlinks help search visibility and authority.

Workflow

An automated sequence (when X happens -> do Y -> ask for approval -> notify).

Demo Mode

A safe sample environment with fake-but-realistic data so you can learn without breaking a real client project.

3. How to start (first 15 minutes)

Step A - Create an account

1. Open the app -> Sign up / Log in.
2. Complete your profile if asked.

Step B - Create Organization

1. Go through Onboarding -> create your Organization (company name).
2. Invite teammates later from Team.

Step C - Create a Project

1. Create a Project for the website you care about.
2. Enter the site name and domain/URL.

Step D - Open Mission Control

1. Open the Project.
2. Go to Mission Control.
3. Optionally start the guided product tour (Help -> Restart guided tour).

Step E - Run your first useful actions

1. Browser Intelligence / Website Analyzer - scan the site.
2. Knowledge Base - upload a short brand/about PDF or notes.
3. Backlink Builder / Opportunity Explorer - see opportunities.

If you only do those three, you already understand 70% of the product.

4. The recommended end-to-end process

This is the standard SEO OS loop. Use it every time for a new site.

#	Step	Where in the app	What you do	What you get
1	Create Organization	Onboarding / Org	Name your company	Team workspace
2	Create Project	Onboarding / Projects	Add the website	Project home
3	Analyze website	Browser Intelligence / Website Analyzer	Run a scan	Pages, contacts, tech signals
4	Teach the AI	Knowledge Base + AI Memory	Upload docs / approve facts	Better AI writing & strategy
5	Discover opportunities	Backlink Builder / Explorer / Prospects	Browse & filter opportunities	List of link targets
6	Plan campaigns	Campaigns / Opportunity Queue	Select opportunities -> create campaign	Structured plan
7	Approve content & emails	Content / Outreach Studio	Generate drafts	Emails, pitches, articles
8	Approve (human check)	Approval Center	Approve or reject AI output	Safe-to-send content
9	Send outreach	Outreach Inbox / Sequences	Send or schedule	Conversations with prospects
10	Automate repeats	Workflows	Turn on templates	Less manual follow-up
11	Verify wins	Backlink Builder -> Pending / Won	Check if links went live	Verified backlinks
12	Measure	Analytics + Reports	Review KPIs / export report	Client/leadership updates
13	Fix site health	Technical SEO	Run audit -> fix issues	Health score improves
14	Connect tools	Integrations	Connect GSC, GA4, Slack, email	Live external data
15	Monitor	Mission Control	Check widgets daily	One-screen operations

Mental model:

Discover -> Plan -> Create -> Approve -> Send -> Verify -> Report -> Improve.

5. Every tool & category explained

Below: What it is, Why it exists, How to use it, and When to use it.

5.1 Mission Control

What it is: The live "control room" for your Project.

Why it exists: So you don't jump between 10 screens to see if work is healthy.

How to use:

1. Open Project -> Mission Control.
2. Read widgets: AI workforce, campaigns, browser intelligence, outreach, workflows, analytics, reports, technical SEO, integrations.
3. Click a widget's "Open ..." button to go deeper.

When: Every morning, and after any major run (scan, campaign, audit).

5.2 Project Home / Overview

What it is: Simple project landing page.

Why: Quick orientation for the site you're working on.

How: Project -> Home.

When: Switching between clients/sites.

5.3 Backlink Builder (Flagship)

What it is: The main system for finding and winning backlinks.

Why: Backlinks are a major SEO growth lever; this module turns "link building" into a pipeline.

Key sub-areas:

Screen	Purpose
Dashboard	Pipeline overview (found -> contacted -> won/lost)
Opportunity Explorer	Search/browse opportunities
Opportunity detail	One opportunity's score, type, next actions
Import	Bring websites/lists from CSV or external sources
AI Classification / Automation	AI labels & prioritizes opportunities
Recommendations	Suggested next best targets
Pipeline	Kanban-style stages
Pending verification	Links claimed but not confirmed
Won / Lost	Outcomes
Relationships (BB)	People/orgs tied to opportunities

Campaigns (BB)	Campaigns created from BB
Tracking	Track link status over time
Audit	Review link quality / issues

How to use (simple):

1. Run website analysis first (so AI knows your niche).
2. Open Opportunity Explorer.
3. Filter high-score opportunities.
4. Send promising ones to Campaigns or Pipeline.
5. Later verify in Pending -> Won.

When: Ongoing - this is the heart of growth work.

5.4 AI Command Center

What it is: A ChatGPT-like chat for your Project.

Why: Ask questions or request actions in natural language ("summarize opportunities", "draft a guest post pitch").

How: Project -> AI Command Center -> type a question.

When: You want help without navigating every screen. Also used as the "AI Help Assistant" from Help Center.

5.5 AI Agents / AI Workforce

What it is: Specialized AI roles (strategist, researcher, outreach manager, QA, etc.).

Why: Different tasks need different "experts."

How: Use from Mission Control / Command Center / agent runs. (Full Agents Catalog UI may still be limited; agents still run behind the scenes.)

When: Campaign planning, research, content, QA checks.

5.6 Knowledge Base

What it is: Your library of brand documents (about us, services, tone of voice, case studies).

Why: AI writes better when it knows your business - not generic internet text.

How:

1. Project -> Knowledge Base.
2. Upload PDFs/docs or paste content.
3. Wait until documents are processed/ready.

When: Right after creating a Project, before generating outreach/content.

5.7 AI Memory

What it is: Facts the AI has learned about this Project (preferences, brand rules, past decisions).

Why: So the AI stays consistent over weeks.

How: Open AI Memory timeline -> review/approve important facts.

When: After Knowledge uploads and after major decisions ("we never pitch gambling sites").

5.8 Website Analyzer

What it is: Higher-level website analysis for SEO intelligence.

Why: Understand pages, topics, and site structure.

How: Project -> Website Analyzer -> run/view analysis.

When: Kickoff of a new Project.

5.9 Browser Intelligence

What it is: Deeper crawl/scan using browser-style intelligence (pages read, contacts, broken links, discoveries).

Why: Powers opportunity discovery and technical signals.

How: Project -> Browser Intelligence -> start a scan -> open scan detail.

When: Before discovery and before technical audits.

5.10 Competitors

What it is: Competitor tracking workspace.

Why: See who you compete with for attention and links.

How: Add/review competitors.

When: Strategy phase and monthly reviews.

5.11 Keywords

What it is: Keyword research and tracking area.

Why: Know what searches matter for the Project.

How: Open Keywords -> explore lists/signals.

When: Content planning and opportunity scoring.

5.12 Prospects (Pipeline)

What it is: Potential partners/sites you may contact.

Why: Turns raw discoveries into a contactable list.

How: Move prospects through pipeline stages.

When: Between discovery and outreach.

5.13 Campaigns

What it is: Planned SEO/backlink campaigns.

Why: Stops random one-off emails; creates managed programs.

Related screens:

Screen	Purpose
Campaigns list	All campaigns
Campaign detail	Progress, timeline, tasks
Opportunity Queue	Opportunities waiting to become campaign work
Approval Center	Human approval gate for AI outputs

How:

1. From opportunities, create or add to a Campaign.
2. Let AI draft plan/content.
3. Approve in Approval Center.
4. Continue to Outreach.

When: Weekly growth sprints.

5.14 Content Studio

What it is: Place for generated content assets (articles, pitches).

Status: May appear as a placeholder depending on release - Outreach Studio covers much of draft generation today.

When: Content-heavy campaigns.

5.15 Outreach Engine

What it is: Email drafting, inbox, and sequences for contacting prospects.

Why: Winning links requires polite, personalized outreach.

Screen	Purpose
Inbox	Conversations / replies
Email Studio	Draft emails with AI
Sequences	Multi-step follow-ups

How:

1. Generate draft in Studio.
2. Get approval if required.
3. Send (connected email provider via Integrations).
4. Track replies in Inbox.
5. Use Sequences for follow-ups.

When: After campaign + approval.

5.16 Relationship Intelligence

What it is: CRM-like view of organizations and people you build relationships with.

Why: Link building is relationship building - not only "send email once."

How: Open Relationships -> browse organizations -> open detail.

When: Parallel to outreach and for long-term partners.

5.17 Workflow Automation

What it is: Visual/automation engine that runs multi-step processes.

Why: Repeatable work (discover -> draft -> approve -> notify) shouldn't be fully manual.

Screen	Purpose
Workflows	Your automations
Templates	Ready-made recipes (guest post, broken link, critical SEO response, etc.)
Builder	Edit nodes (trigger -> AI -> approval -> end)
Runs	History of executions

How:

1. Open Templates -> create from a template.
2. Activate the workflow.
3. Watch Runs when events fire.

When: After you understand the manual process once.

5.18 Technical SEO Engine

What it is: Website health auditor (broken links, HTTPS, meta, schema, robots, sitemap, accessibility signals, etc.).

Why: Great content/outreach fails if the site is technically sick.

How:

1. Project -> Technical SEO.
2. Enter URL -> choose full / incremental / quick.
3. Start audit.
4. Open issues -> read severity, business/SEO impact, recommended fix.
5. Use AI Fix Assistant suggestions.
6. Mark fixed / ignored.
7. Export CSV/JSON/PDF if needed.

When: Monthly, and after big site changes.

5.19 Integrations Hub

What it is: Connect external tools to SEO OS.

Provider	Use
Google Search Console	Search queries, clicks, pages, devices

Google Analytics 4	Sessions, users, conversions, sources
SMTP / Gmail / Outlook	Send outreach email
WordPress	Draft posts from AI (publishing stays user-controlled)
Slack	Alerts for workflows, approvals, critical SEO

How:

1. Project Integrations or Org Integrations.
2. Click Connect on a provider.
3. Run Sync.
4. Check health / permissions.

When: After Project setup; before serious reporting.

5.20 Analytics

What it is: Measurement dashboards across SEO, campaigns, outreach, workflows, AI, etc.

Why: Prove what is working.

How: Open Analytics -> switch sections (Executive, SEO, Backlinks, Campaigns...). Export if needed.

When: Weekly reviews.

5.21 Reports

What it is: Client/leadership report generator (executive, campaign, backlink, monthly...).

Why: Turn data into shareable PDF/PPTX/CSV/JSON.

How:

1. Reports -> create report type.
2. Optional brand/white-label.
3. Generate.
4. Export or email delivery.

When: Monthly client meetings or board updates.

5.22 Search (in-app)

What it is: Quick find across the Project.

How: Use Search from mobile/nav or command palette (Ctrl/? + K).

When: You know the name but not the menu location.

6. Organization-level tools

These live under /org/... (company level, not one website).

Tool	What it is	How to use
------	------------	------------

Team	Members & roles (owner/admin/member/viewer)	Invite people; assign least privilege needed
Settings	Org profile/settings	Keep company info accurate
Executive Dashboard	Leadership metrics across projects	Show productivity / portfolio health
Integrations	Same hub, org context	Connect shared providers
Help	Help Center, shortcuts, tips, restart tour	First stop when stuck
Feedback	Closed Beta feedback (bugs/features)	Report issues with severity + steps
Closed Beta	Beta dashboard, invites, announcements	Admins enable beta / create invite codes
Notifications / Security / Audit Log / Billing	Some are planned / placeholder	Use Help/Feedback if you need something missing

7. Tips, shortcuts, and Demo Mode

Demo Mode

- Toggle Demo Mode from the user menu.
- Explores realistic sample data safely.
- Perfect for training freshers and client demos.

Useful shortcuts

Shortcut	Action
Ctrl/? + K	Command palette (jump anywhere)
Esc	Close dialogs / tour
Tab	Move between fields/buttons

Freshers' golden rules

1. Always work inside the correct Project.
2. Scan -> Knowledge -> Discover -> Campaign -> Approve -> Outreach -> Verify -> Report.
3. Never send AI outreach without reading it (use Approvals).
4. Check Mission Control before asking "is it working?"
5. File bugs in Feedback instead of guessing.

8. Simple glossary

Term	Meaning
SEO	Search Engine Optimization - helping a site appear in search
Crawl / Scan	Automated visit of site pages to collect data
SERP	Search Engine Results Page
CTA	Call to action (button/link asking user to do something)
Domain authority (informal)	How "strong" a site is seen for links
Schema / JSON-LD	Structured data helping search engines understand pages

Canonical	Preferred URL when duplicates exist
Robots.txt	File telling crawlers what they may access
Sitemap	List of important URLs for search engines
CWV	Core Web Vitals - speed/UX quality signals
RBAC	Role-based access control (who can do what)

9. What is still "coming later" / limited

Be honest with users:

- Billing / Marketplace - not for day-to-day use yet (placeholders).
- Some Settings / Agents Catalog / Content Studio screens may still be incomplete.
- Some Integrations connect in a simplified/stub mode until full OAuth apps are configured.
- Product is currently oriented to Closed Beta validation before a full public 1.0 launch.

If something looks empty, check Help, try Demo Mode, or submit Feedback.

Quick cheat sheet (print this)

1. Login
2. Org + Project
3. Mission Control
4. Browser Intelligence scan
5. Upload Knowledge
6. Backlink Builder -> opportunities
7. Campaign + Approval
8. Outreach send
9. Verify Won links
10. Analytics + Report
11. Technical SEO audit
12. Integrations sync

That's SEO OS.

Document version: aligned with SEO OS v0.99.5 Closed Beta.

For technical/ops docs, see [docs/epic-11-production-readiness/](#) and [docs/epic-12-closed-beta/](#).
