

SEO OS Backlink Workflow Guide

Beginner's Manual

This guide explains how to use SEO OS from the moment you log in until you successfully acquire and verify backlinks. It assumes you are completely new to SEO and backlink building.

Step 1 – Login & Create Organization

Sign in to SEO OS. Create your organization (your company or client). Organizations keep projects, users, campaigns, and reports separated.

Step 2 – Create a Project

Create one project for each website you want to optimize. Example: ChefGAA, Logisoft, or Desi Dhamaka. Enter the website URL and basic business information.

Step 3 – Build the Knowledge Base

Upload brand guidelines, service documents, PDFs, menus, product information, customer personas, and existing blog content. The AI uses this information to write relevant outreach emails and content.

Step 4 – Run Browser Intelligence

Enter your website URL and start a scan. SEO OS discovers pages, technologies, contact pages, resource pages, and SEO opportunities. Review the AI summary after the scan finishes.

Step 5 – Discover Competitors

Review AI-suggested competitors or add your own. Analyze their content and backlink strategies to understand where opportunities exist.

Step 6 – Keyword Research

Generate keyword ideas related to your business. Review search intent, topic clusters, and priority scores. Select the keywords you want to target.

Step 7 – Import Target Websites

Import websites using CSV, Excel, TXT, or manual entry. These are websites where you may try to earn backlinks.

Step 8 – Automatic Website Analysis

SEO OS validates every imported website, removes duplicates, detects backlink opportunities (guest posts, directories, forums, Q&A, resource pages, podcasts, citations, etc.), and scores each opportunity by relevance, spam risk, authority, and success probability.

Step 9 – AI Content Generation

For each opportunity, AI prepares the correct content: guest posts, outreach emails, business descriptions, forum replies, Q&A; answers, press releases, broken-link replacement suggestions, and more.

Step 10 – Review & Approval

Review all AI-generated content. Edit if necessary. Human approval should happen before any outreach or submission.

Step 11 – Campaign Creation

Group approved opportunities into campaigns. Example: Guest Posts Campaign, Directory Listings Campaign, Resource Page Campaign. Track campaign progress in Mission Control.

Step 12 – Outreach

Use the Outreach module to generate personalized emails, schedule follow-ups, and track conversations. Some websites require manual submission or approval by the website owner.

Step 13 – Relationship Management

Store contacts, companies, conversations, and timelines. Relationship Intelligence helps prioritize the best people to contact.

Step 14 – Backlink Verification

After a backlink is published, mark it as Won and verify it. Check that the backlink exists, points to the correct page, uses the expected anchor text, and remains live.

Step 15 – Mission Control

Mission Control gives a live overview of projects, AI agents, campaigns, knowledge base, browser intelligence, relationships, and backlink progress.

Step 16 – Improve Continuously

Repeat the process by importing new websites, generating more opportunities, running additional campaigns, and monitoring existing backlinks.

Typical End-to-End Workflow

Login → Create Organization → Create Project → Upload Knowledge → Run Browser Intelligence → Discover Competitors → Research Keywords → Import Target Websites → AI Analysis → Generate Content → Review → Create Campaign → Outreach → Track Replies → Verify Backlinks → Monitor Progress in Mission Control

Important: SEO OS helps automate research, organization, content generation, campaign management, and backlink verification. Publishing backlinks on third-party websites still depends on the policies and approval processes of those websites.
